

SG6860

Low-Cost, Green-Mode PWM Controller for Flyback Converters

Features

- Green-Mode PWM
- Supports the “Blue Angel” Eco Standard
- Low Startup Current: 9µA
- Low Operating Current: 3mA
- Leading-Edge Blanking
- Constant Output Power Limit
- Universal Input
- Built-in Synchronized Slope Compensation
- Current Mode Operation
- Cycle-by-Cycle Current Limiting
- Under-Voltage Lockout (UVLO)
- Programmable PWM Frequency with Frequency Hopping
- V_{DD} Over-Voltage Protection (Latch off)
- Gate Output Voltage Clamped at 17V
- Low Cost
- Few External Components Required
- Small SOT-26 Package

Applications

- Power Adaptors
- Open-Frame SMPS

Description

This highly integrated PWM controller provides several enhancements designed to meet the low standby-power needs of low-power SMPS. To minimize standby power consumption, a proprietary green-mode function provides off-time modulation to linearly decrease the switching frequency under light-load conditions. This green-mode function enables the power supply to meet even strict power conservation requirements.

The BiCMOS fabrication process enables reducing the startup current to 9µA and the operating current to 3mA. To further improve power conservation, a large startup resistance can be used. Built-in synchronized slope compensation ensures the stability of peak current mode control. Proprietary internal compensation provides a constant output power limit over a universal AC input range (90V_{AC} to 264V_{AC}). Pulse-by-pulse current limiting ensures safe operation even during short-circuits.

To protect the external power MOSFET from being damaged by supply over voltage, the SG6860’s output driver is clamped at 17V. SG6860 controllers can improve the performance and reduce the production cost of power supplies. The SG6860 can replace linear and RCC-mode power adapters. It is available in 6-pin SOT-26 package.

Pin Definitions

Pin #	Name	Description
1	GND	Ground. For ATX SMPS, it detects AC line voltage through the main transformer.
2	FB	Feedback.
3	RI	Reference Setting. A resistor connected from the RI pin to ground generates a constant current source used to charge an internal capacitor and determine the switching frequency. Increasing the resistance reduces the amplitude of the current source and reduces the switching frequency. A 95kΩ resistor, R_i , results in a 13μA constant current, I_i , and a 70kHz switching frequency.
4	SENSE	Current Sense. This pin senses the voltage across a resistor. When the voltage reaches the internal threshold, PWM output is disabled, which activates over-current protection. This pin also provides current amplitude data for current-mode control.
5	VDD	Power Supply.
6	GATE	Driver Output. The totem-pole output driver for driving the power MOSFET.

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Symbol	Parameter	Min.	Max.	Unit	
V _{VDD}	DC Supply Voltage		30	V	
V _{FB}	Input Voltage to FB Pin	-0.3	7.0	V	
V _{SENSE}	Input Voltage to Sense Pin	-0.3	7.0	V

		Charged Device Model, JESD22-C101		1000	V

Notes:

- All voltage values, except differential voltage, are given with respect to GND pin.
- Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device.

Recommended Operating Conditions

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to Absolute Maximum Ratings.

Functional Description

SG6860 integrates many useful designs into one controller for low-power switch-mode power supplies. The following descriptions highlight some of the features of the SG6860 series.

Startup Current

The startup current is only 9 μ A, which allows a start-up resistor with high resistance and low-wattage to supply the startup power for the controller. A 1.5M Ω , 0.25W, startup resistor and a 10 μ F/25V V_{DD} hold-up capacitor are sufficient for an AC-to-DC power adapter with a wide input range of 90V_{AC} to 264V_{AC}.

Operating Current

The operating current has been reduced to 3mA, which results in higher efficiency and reduces the V_{DD} hold-up capacitance requirement.

Green-Mode Operation

The proprietary green-mode function provides off-time modulation to linearly decrease the switching frequency under light-load conditions. On-time is limited to provide stronger protection against brownouts and abnormal conditions. The feedback current, which is sampled from the voltage feedback loop, is taken as the reference. Once the feedback current exceeds the threshold current, the switching frequency starts to decrease. This green-mode function dramatically reduces power consumption under light-load and zero-load conditions. Power supplies using the SG6860 can meet even strict regulations regarding standby power consumption.

Oscillator Operation

A resistor connected from the RI pin to ground generates a constant current source used to charge an internal capacitor. The charge time determines the internal clock speed and the switching frequency. Increasing the resistance reduces the amplitude of the input current and reduces the switching frequency. A 95k Ω resistor, R_I , results in a 13 μ A constant current, I_I , and a 70kHz switching frequency. The relationship between R_I and the switching frequency is:

$$f_{PWM} = \frac{6650}{R_I(k\Omega)} \text{ (kHz)} \quad (1)$$

The range of the oscillation frequency is designed to be within 50kHz ~ 100kHz.

Leading-Edge Blanking

Each time the power MOSFET is switched on, a turn-on spike occurs at the sense-resistor. To avoid premature termination of the switching pulse, a 300ns leading-edge blanking time is built in. Conventional RC filtering can therefore be omitted. During this blanking period, the current-limit comparator is disabled and cannot switch off the gate driver.

Constant Output Power Limit

When the SENSE voltage across the sense resistor, R_S , reaches the threshold voltage (~1.00V), the output GATE drive is turned off after propagation delay, t_{PD} . This propagation delay introduces an additional current proportional to $t_{PD} \cdot V_{IN} / L_p$. The propagation delay is nearly constant, regardless of the input line voltage V_{IN} . Higher input line voltages result in larger additional currents. At high input line voltages, the output power limit is higher than at low input line voltages.

To compensate for this output power limit variation across a wide AC input range, the threshold voltage is adjusted by adding a positive ramp. This ramp signal rises from 0.80V to 1.02V, then flattens out at 1.02V. A smaller threshold voltage forces the output GATE drive to terminate earlier. This reduces the total PWM turn-on time and makes the output power equal to that of low line input. This proprietary internal compensation ensures a constant output power limit for a wide AC input voltage range (90V_{AC} to 264V_{AC}).

Under-Voltage Lockout (UVLO)

The turn-on and turn-off thresholds are fixed internally at 16.5V and 9.5V. During startup, the hold-up capacitor must be charged to 16.5V through the startup resistor to enable SG6860. The hold-up capacitor continues to supply V_{DD} until power can be delivered from the auxiliary winding of the main transformer. V_{DD} must not drop below 9.5V during the startup process. This UVLO hysteresis window ensures that the hold-up capacitor is adequate to supply V_{DD} during startup.

Gate Output

The SG6860 BiCMOS output stage is a fast totem pole gate driver. Cross conduction has been avoided to minimize heat dissipation, increase efficiency, and enhance reliability. The output driver is clamped by an internal 17V Zener diode to protect power MOSFET transistors against undesired over-voltage gate signals.

Built-in Slope Compensation

The sensed voltage across the current sense resistor is used for current mode control and pulse-by-pulse current limiting. Built-in slope compensation improves stability and prevents sub-harmonic oscillations due to peak current mode control. The SG6860 has a synchronized, positively-sloped ramp built-in at each switching cycle. The slope of the ramp is:

$$\frac{0.36 \times \text{Duty}}{\text{Duty(max.)}} \quad (2)$$

Noise Immunity

Noise from the current sense or the control signal can cause significant pulse-width jitter, particularly in continuous-conduction mode. While slope compensation helps alleviate these problems, further precautions should be taken. Good placement and layout practices should be followed. Avoiding long PCB traces and component leads, locating compensation and filter components near the SG6860, and increasing power MOS gate resistance improve performance.

As used herein:

- Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.
- A critical component in any component of a life support, device, or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

ANTI-COUNTERFEITING POLICY

Fairchild Semiconductor Corporation's Anti-Counterfeiting Policy. Fairchild's Anti-Counterfeiting Policy is also stated on our external website, www.fairchildsemi.com, under Sales Support.

Counterfeiting of semiconductor parts is a growing problem in the industry. All manufacturers of semiconductor products are experiencing counterfeiting of their parts. Customers who inadvertently purchase counterfeit parts experience many problems such as loss of brand reputation, substandard performance, failed applications, and increased cost of production and manufacturing delays. Fairchild is taking strong measures to protect ourselves and our customers from the proliferation of counterfeit parts. Fairchild strongly encourages customers to purchase Fairchild parts either directly from Fairchild or from Authorized Fairchild Distributors who are listed by country on our web page cited above. Products customers buy either from Fairchild directly or from Authorized Fairchild Distributors are genuine parts, have full traceability, meet Fairchild's quality standards for handling and storage and provide access to Fairchild's full range of up-to-date technical and product information. Fairchild and our Authorized Distributors will stand behind all warranties and will appropriately address any warranty issues that may arise. Fairchild will not provide any warranty coverage or other assistance for parts bought from Unauthorized Sources. Fairchild is committed to combat this global problem and encourage our customers to do their part in stopping this practice by buying direct or from authorized distributors.
